Create the Necessary Linked Services

Create any linked services necessary to accomplish the objective of copying the log data to the output storage account.

Azure Data Factory

Create the Necessary Datasets

Create any datasets necessary to accomplish the objective of copying the log data to the output storage account. The copied **logs.txt** data must end up being in a **data** folder in the **output** container of the **outputcal** storage account.

Azure Data Factory

Create the Necessary Data Factory Pipeline

[Menu](#)[Browse Library](#)

Manually Trigger the Pipeline

Manually trigger the pipeline to perform the copy operation. You must manually trigger the pipeline even if you previously performed a debug run of the pipeline.

Azure Data Factory

Data Copied to Output Storage Container

Check if the data has been copied to the **output** storage container in the output storage account (storage account name beginning with **outputcal**).
